The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The cnownian also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production, and the cell is also useful for identifying compounds that modulate expression of the polynucleotide sequences compounds that modulate expression of the polynucleotide sequences compounds the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined minunodeficiency (SCID)), autoimmune disorders (e.g. cultiple sclerosis), blood disorders (e.g. thrombocytopeania), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis).

The polynucleotide sequences of the invention are also useful in gene therapy. AAS62214-AAS62838 repersent the CDNA sequences of the therapy. AAS62214-AAS62838 repersent the CDNA sequences of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EBV-transformed cell lines and mouse-human heterohybridomas producing human Mabs specific for the gg120 V3 loop of HIV-1 MN isolate were obtained. Mab 447-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain V region was derived from 447-52D and to which a signal sequence and a H chain intronic sequence are appended, fused to a fragment contg. a short intronic segment of the human gamma 1 encoding domain in its genomic form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TGGGGCCAGGGCCCTGGTCACCGTCTCCTCAGCTAGCACCAAGGGCCCCATCGGTCTTC

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent disorders, such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                      PESULT 10
PC4436
monoclonal antibody 13-1 heavy chain - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Accession: PC4436
C;Accession: PC4436
R;Akashi, S:, Kato, K.; Torizaw, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Harada, A. Biochem. Biophys. Res. Commun. 240, 566-572, 1997
A;Title: Structural characterization of mouse monoclonal antibody 13-1 against a porphya.
A;Reference number: JC5810; MUID:98063277; PMID:9398605
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oxidase activity. C/Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds: In some cases, such as IGA and IGM, the subunits associate into Id C; Superfamily: immunoglobulin C region; immunoglobulin homology
C/Seywords duplication; glycoprotein; heterotetramer; immunoglobulin
F/20-85/Domain: immunoglobulin homology <IM1>
F/20-89-110/Region: hinge
